

# AI ALGO (S) PTE LTD

## Volume Licensing & Tiered Commercial Framework (India GTM Strategy)

---

**Document Purpose:** This document outlines the standardized, volume-driven software transfer pricing framework for **RetailNazar.com** and **SecureWatch Pro**. It serves as the baseline infrastructure for channel ecosystem negotiations with Tier-1 original equipment manufacturers (OEMs), domestic manufacturing partners, and national system integrators within the Indian subcontinent.

### 1. THE CORE COMMERCIAL MECHANISM: DIGITAL AI TOKENS

To eliminate complex billing administration, API metering variances, and local collection delays, all SaaS licenses are managed through an upfront **Digital AI Token Engine**. Hardware partners purchase pre-paid token allocations in structured tranches.

- **Token Definition:** One (1) Digital AI Token activates one (1) single video stream or camera node for exactly one (1) calendar month on either the RetailNazar.com or SecureWatch Pro cloud environments.
- **Upfront Fulfillment:** Tokens are purchased and provisioned digitally at the start of each quarter. Hardware players draw down tokens from their corporate wallet as local partners activate camera streams in the field.
- **Annuity Model Built-in:** Tokens expire precisely 30 days after activation, ensuring an automatic monthly recurring renewal loop that requires zero sales touchpoints.

### 2. TIERED VOLUME TRANSFER PRICING MATRIX

The transfer price per token drops strictly as the total volume of committed and active camera streams scales across the national network. This framework protects core margins while directly addressing the volume capabilities of market juggernauts.

| PRICING TIER                   | ACTIVE VOLUME THRESHOLD (CONCURRENT STREAMS / MO) | TRANSFER PRICE PER TOKEN (INR / MONTH / STREAM) | EQUIVALENT ANNUAL COST (INR / PER STREAM) | TARGET CHANNEL SEGMENTS                                                  |
|--------------------------------|---------------------------------------------------|-------------------------------------------------|-------------------------------------------|--------------------------------------------------------------------------|
| <b>Tier 4</b><br>Standard      | 1 – 999 streams                                   | ₹850                                            | ₹10,200                                   | Independent System Integrators, Boutique Pilots, Regional Accounts       |
| <b>Tier 3</b><br>Silver Scaler | 1,000 – 4,999 streams                             | ₹600                                            | ₹7,200                                    | <b>Vintron Pilot Target</b> , Regional Security Distributors             |
| <b>Tier 2</b><br>Gold Volume   | 5,000 – 24,999 streams                            | ₹450                                            | ₹5,400                                    | <b>Vintron National Target</b> , Mid-Tier Smart City Bidders             |
| <b>Tier 1</b><br>OEM Elite     | <b>25,000+ streams</b>                            | <b>₹300</b>                                     | <b>₹3,600</b>                             | <b>CP Plus Target Tier, Tier-1 National Telecoms &amp; Conglomerates</b> |

**Strategic Negotiation Lever:** Tier-1 pricing (₹300/mo) is explicitly ring-fenced for massive institutional deployments. If an arrogant market leader demands Tier-1 pricing from day one, they must commit to a minimum quarterly purchase block of 75,000 tokens (equivalent to 25,000 streams sustained for 3 months), paid upfront. If they fail to deploy this volume, their pricing automatically steps up to Tier 2 or 3 in the following quarter.

### 3. MARKET SEGREGATION & PRODUCT TRACK ALIGNMENT

To maintain structural balance and avoid channel cross-cannibalization between a nimble domestic manufacturer (Vintron) and a massive market volume leader (CP Plus), the market access is strictly segregated by operational tracks:

| PRODUCT ECOSYSTEM                               | VINTRON OPERATIONAL TRACK<br>(THE AGILE PROTOTYPER)                                                                                                                                                                                                             | CP PLUS OPERATIONAL TRACK<br>(THE VOLUME ELEPHANT)                                                                                                                                                                                                                                 |

## 4. OPERATIONAL DEMARCATION & LIABILITY SAFEGUARDS

To preserve maximum business agility and eliminate operational liability for AI Algo, the partnership agreements govern a strict division of technical and physical execution responsibilities:

### AI Algo Responsibilities (Software Core)

- Maintain core cloud infrastructure availability and API endpoint stability (99.9% uptime target).
- Deliver weekly cloud-level updates to computer vision models, anomaly thresholds, and analytic reporting matrices.
- Provide Tier-3 developer-level remote technical assistance for complex integration anomalies.

### Hardware Partner Responsibilities (Field Edge)

- Manage all localized field engineering, structural mounting, wiring, and network optimization.
- Provide Tier-1 and Tier-2 on-site technical customer service through certified dealer channels.
- Retain 100% legal, compliance, and warranty accountability for all physical hardware components, firmware bugs, and Bureau of Indian Standards (BIS) filings.

---

**Summary Directive for Board Strategy:** Under no circumstances will any exclusive pan-India rights be granted to either player. Volume pricing scales automatically protect our core intellectual property while ensuring both David and Goliath pay exactly the value they extract from the ecosystem.
