

Company: BrainGuardX AI Technologies Pvt. Ltd. **Product:** Retail Nazar (Vantag platform) **Document:** High-Value Counter Feature & Go-To-Market Overview **Version:** 1.0 **Prepared:** August 2026 **Contact:** support@retailnazar.com | retailnazar.com

1. The one-line pitch

"No shelves. No POS. Still caught."

Most theft-detection AI assumes a supermarket: shelves, product barcodes, a POS terminal. That assumption fails the moment you walk into a jewellery shop, a watch boutique, or a luxury handbag counter where the goods sit inside a glass case and the salesperson hands them across the counter to the customer. **High-Value Counter** is the first Retail Nazar detector built for that world: it watches the counter, the tray, and the hand, not the shelf.

2. The problem it solves

In a high-value retail environment, the theft moment is not a shelf sweep. It is a hand. Specifically:

The act	What it looks like on camera
Reach-in	A customer (or staff member) dips a hand into the open display tray while the salesperson is distracted
Tray change	One moment the tray is full; a moment later an item is gone
Grab & run	The person takes the item and moves fast toward the exit

Traditional CCTV records all of this for review the next morning, after the item is already on a resale site. Retail Nazar alerts the owner **in real time**, while the item is still in the building.

Why existing systems miss it:

- No shelves › shelf-based AI has nothing to track
- No POS › "item vs sale" reconciliation is impossible
- Counter service is normal › motion detectors fire on every legitimate handover
- High staff involvement › you cannot simply alarm every person near the case

High-Value Counter is designed for exactly these conditions.

3. What "High-Value Counter" is

It is a dedicated detection mode that turns an ordinary counter camera into a **theft-watch station**. The retailer (or installer) draws a few simple shapes on the live camera view once Serving Counter, Display Tray, Display Case, Exit Door, Approach Corridor and Retail Nazar runs **four coordinated AI signals** on that single camera, continuously.

No extra hardware. No new cameras. No POS integration. It works on the IP cameras the shop already owns.

4. The four detectors (in plain language)

#	Detector	What it watches for	Alert
1	Case Hand Reach	A hand crosses into the display tray, stays, then withdraws	"Case Hand Reach hand reached into display case and withdrew"
2	Tray Change	The contents of the display tray visibly drop (an item removed) while a person is at the counter	"Tray Change tray contents removed"
3	Grab & Run	A person moves from the display case to the exit door unusually fast	"Grab & Run fast case→exit movement"
4	Full Chain Demo	A one-click simulation that fires all three signals in story order, so a salesperson can show the flow live without a real theft	"Fire High-Value Counter Demo"

Together they answer the question every jeweller asks: **"when did the hand go in, and did something leave?"**

5. What makes it different

Differentiator	Why it matters
No shelves required	The geometry is a counter, tray, case and exit not shelf rows
No POS required	Detection is purely visual; nothing to integrate, nothing to reconcile
One camera, many brains	The same counter camera simultaneously runs hand-reach, tray-change, grab-and-run plus the other Retail Nazar models (loitering, restricted zone, fall, queue, etc.)
Per-finger precision	21-point hand tracking measures the actual fingertip entering the tray not a rough "a person is nearby" guess
Works on existing cameras	Connects to the Hikvision / Dahua / ONVIF cameras the shop already installed
Runs on the edge	Video is analysed on-site; it does not need to leave the store
Real-time, not next-morning	Alerts reach the owner's phone in under a second

6. Who it is for (target verticals)

- **Jewellery & gold stores** trays, cases, counter handovers
- **Luxury watches** showcase counters and try-on areas
- **Premium bags & leather goods** display tables, boutique counters
- **Mobile & electronics showcases** demo units handed across the counter
- **Premium eyewear / accessories** high-value, small-footprint items
- **Pawn shops & money counters** high-value items across a service counter

Any business where **the item is small, expensive, and handed over a counter** is a High-Value Counter customer.

7. Features & functions (what the retailer gets)

- **Point-and-click polygon editor** draw the zones on the live camera snapshot in the dashboard; no YAML, no technician.
- **Three individually-fireable test cards** in the Demo Center (Case Hand Reach, Tray Change, Grab & Run) so the team can practise and demo.
- **One-click full demo** that replays the whole theft story in order.
- **Live Incidents** with severity, camera, time, and thumbnail "Case Hand Reach", "Tray Change", "Grab & Run" appear with clear labels and colors.
- **Risk scoring** the events feed the store's live risk score (Grab & Run is the highest-weighted signal).
- **Help Center content** a High-Value Counter FAQ category, a setup guide, a diagram, and an animated "How it works / How to configure" story for training.

8. The tech under the hood (for the technically curious)

- **Detection:** Ultralytics **YOLO26** (NMS-free, DFL-free) roughly 2× faster on CPU than the previous generation with better small-object accuracy.
- **Pose:** YOLO26-pose for wrist/elbow geometry.
- **Hands: MediaPipe HandLandmarker 21 landmark points per hand** (five fingertips, palm, wrist), so "the hand entered the tray" is a measured geometric fact, not a bounding-box estimate.
- **Orchestration:** a GPU/CPU scheduler runs the heavy models at different frame rates so one slow model never blocks the others.
Sales translation: "It now tracks the fingertips, not just the body."

9. How to see it live (2 minutes)

1. Open the dashboard › **High-Value Counter** page.
2. Pick the counter camera and draw the **Serving Counter**, **Display Tray**, **Display Case** and **Exit Door** polygons on the live snapshot.
3. Save.
4. Go to **Demo Center** › "**Fire High-Value Counter Demo**" › watch the three alerts appear in **Incidents**.
No theft required to demo it.

10. Honest boundaries (say this clearly)

Retail Nazar's High-Value Counter is a **real-time review candidate**, not a legal verdict:

- It flags the behaviour (hand reach, tray change, fast exit) for an operator to confirm.
- A staff member servicing the case can trigger the same "hand reach" signal

that is why the alerts are designed for **immediate human confirmation**, not automatic arrest.

- It is a **deterrent + fastest-response** tool: the alert fires during the act, so the owner can intervene before the item leaves the premises.

This honest framing increases trust with serious retailers and it is the correct one.

11. Message for the sales team

"Stop pitching shelves. Pitch the counter. Jewellers don't lose stock off a shelf they lose it the moment a hand dips into an open tray. We now watch that hand, finger by finger, and alert before the customer reaches the door."

Use this document as the **what/why**, and the companion `high_value_counter_sales_pitch.md` as the **how** (scripts, objections, demo flow, ROI math).
