

TECHNICAL ARCHITECTURE

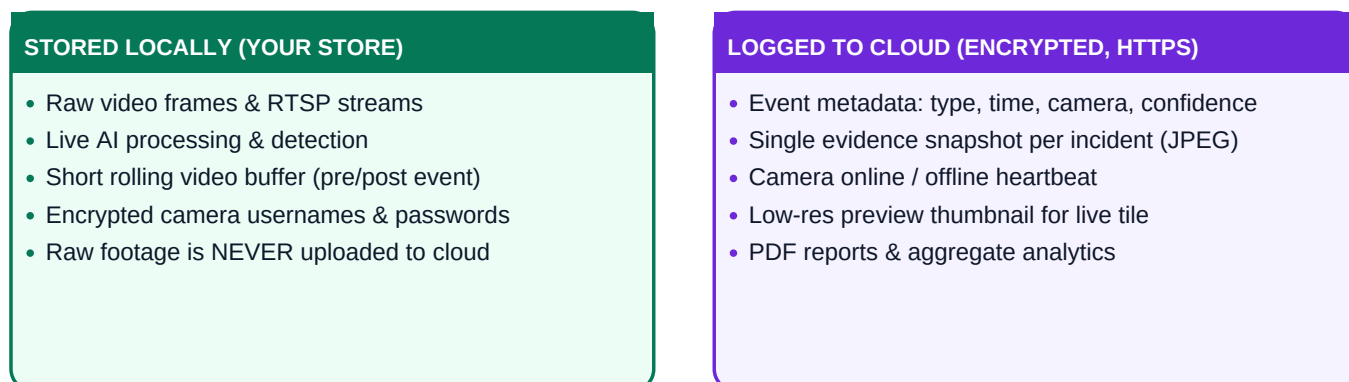

How Vantag / Nazar Moves & Protects Your Data

Edge-first AI surveillance | Video stays in your store | Only insights reach the cloud

END-TO-END DATA FLOW

WHAT STAYS LOCAL VS. WHAT GOES TO CLOUD

Privacy by Design

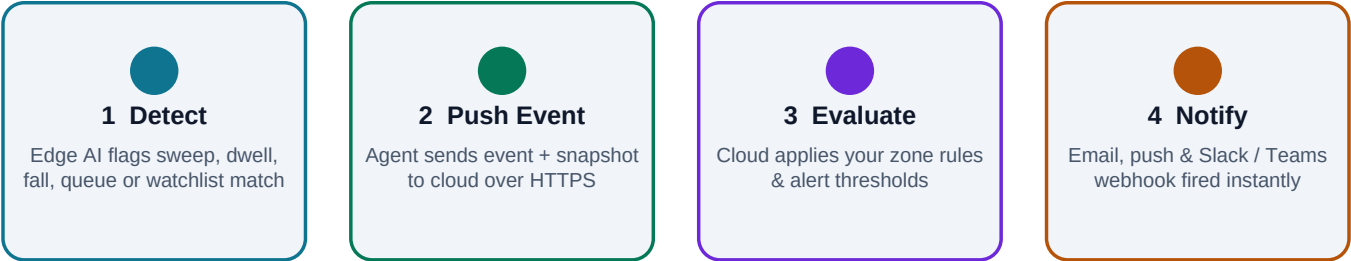

Your continuous camera video never leaves the store network. The cloud only ever receives lightweight insights - a snapshot and a few bytes of metadata when an event is detected. This keeps bandwidth low (works on 4G) and your footage private.

TECHNICAL ARCHITECTURE

How Vantag / Nazar Moves & Protects Your Data

Alert pipeline & security model

HOW ALERTS ARE SENT

SECURITY & TRANSPORT

LAYER	MECHANISM
Camera credentials	AES-encrypted at rest with a pinned server key; never exposed in plain text
Agent <-> Cloud	HTTPS / TLS; authenticated per-tenant edge token
Live preview	WebSocket channel + authenticated snapshot blobs
Data isolation	Per-tenant separation; each store sees only its own cameras & events
Bandwidth	Only snapshots + metadata leave site - typically under 50 KB per event

 Edge / Access  Stays Local  Cloud Logged
